

Bitcode Assignment 2

1 Design Patterns

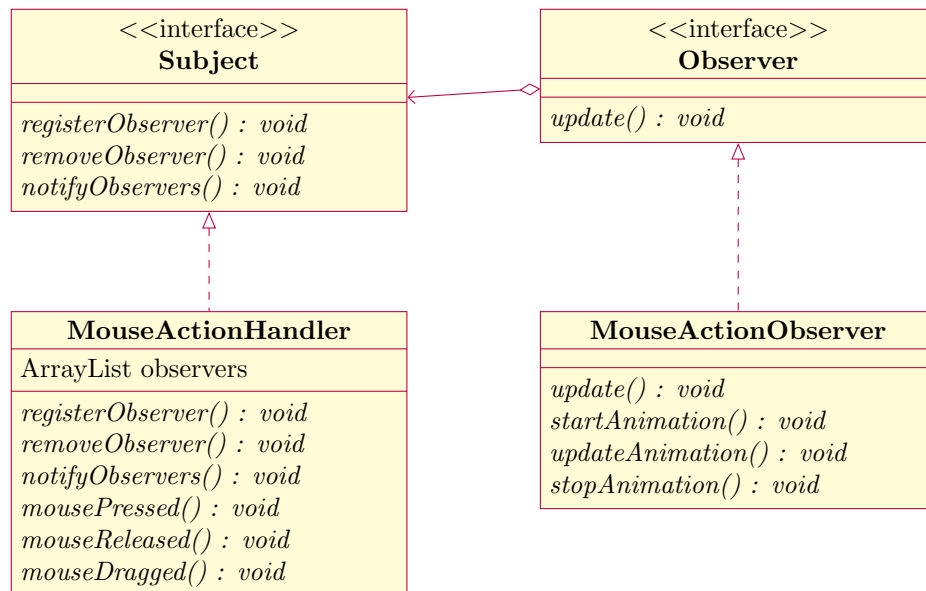

Using design patterns in software project is a good practice. It helps to make your software understandable, sustainable and expendable. We have chosen two design patterns and implemented them in our existing code, the observer pattern and the factory pattern.

1.1 The Observer Design Pattern

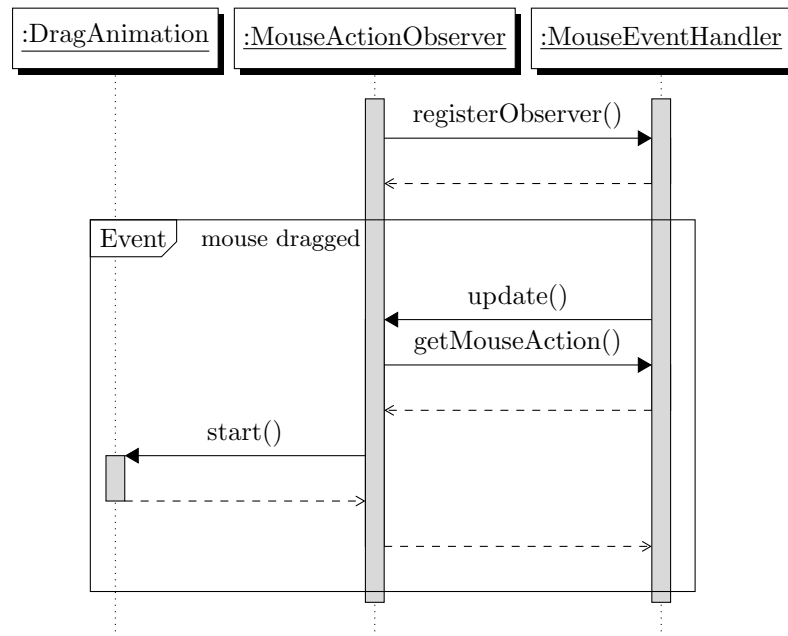

The observer pattern is implemented between the `MouseActionHandler` class (subject) and the `DragAnimation` class (observer). The `MouseActionHandler` listens for mouse input in a given window. A object of the `DragAnimation` class is created when a mouse drag is registered and updated when the position of the mouse pointer changes.

We have chosen this pattern on this location because it enables us to create more observers for the `MouseActionHandler` in the future. Therefore it will save time to implement new features that need the `MouseActionHandler` class.

1.1.1 Observer Class Diagram

1.1.2 Observer Sequence Diagram

1.2 The Factory Design Pattern

2 Your wish is my command

Our client wanted to have two new features implemented, which consist of a high score page and maximum amount of moves per level. For each each feature we have created new requirements and a software design.

2.1 High Score Page

tbd

2.1.1 Requirements

tbd

2.1.2 Software Design

tbd use UML

2.2 Maximum Moves per Level

tbd

2.2.1 Requirements

tbd

2.2.2 Software Design

tbd use UML

3 Turn-based Multiplayer

In exercise three we have been asked to implement a feature that we wanted to implement. We have chosen to implement turn-based Multiplayer. For this feature we also created new requirements and a software design.

3.1 Requirements
